

Audio to Text App - Button Help Guide

This guide explains the visible buttons in the provided desktop template. The numbered screenshot on page 1 matches the detailed descriptions on page 2.

Quick workflow: 1) Choose an audio source using **Open audio file** or the microphone controls. 2) Run **Transcribe**. 3) Review the transcript. 4) Export using **Download TXT** or **Download DOCX**.

Disabled buttons: In the screenshot, **Play recording** and **Stop recording** appear greyed out. That usually means a recording has not started yet, or there is no local recording available to play.

Detailed Button Reference

No.	Button	Main purpose	How to use it	Notes
1	Open audio file	Load an existing audio file from the computer.	Click the button, browse to a supported audio file, and select it. After selection, the filename/status area should update.	Use this when the audio already exists as a saved file.
2	Download TXT	Export the transcript as a plain-text file.	After transcription is complete, click this button and choose where to save the .txt file.	Best for quick sharing, editing, or copying into other tools.
3	Download DOCX	Export the transcript as a Word document.	After transcription is complete, click this button and choose the save location for the .docx file.	Useful when formatting or later editing in Microsoft Word is needed.
4	Start recording	Begin microphone capture.	Click once to start recording live audio from the selected/default microphone. Speak after the recording starts.	This is the first microphone action in a live-recording workflow.
5	Play recording	Play back the recorded microphone audio.	Click after a recording is available to listen before transcription.	Often disabled until a recording has been captured successfully.
6	Stop recording	End the active microphone recording session.	Click when you want to finish the live capture and keep the recorded audio for review/transcription.	Usually enabled only while recording is actively running.
7	Transcribe	Convert the loaded or recorded audio into text.	Click after choosing a file or finishing a microphone recording. The transcript area and time-stamped segment table should then populate.	This is the main action button for speech-to-text conversion.
8	Clear output	Remove current transcript results from the interface.	Click to clear the transcript text, segment list, counters, and related output fields before starting another run.	Helpful between separate jobs to avoid confusion.
9	Help	Open app instructions or a support/help view.	Click when the user needs guidance on how the interface works.	This PDF can be used as the content for that help action.

Extra usage notes

Transcript area: After transcription, the large white panel labeled **Transcript** should display the full text. **Time-stamped Segments:** The lower table is meant for segment-level results such as start time, end time, and recognized text. **Status box:** The left-side status panel shows readiness and model/device details, such as model name, device, and compute type.
